

Tablekeeper

Built by four AI agents. One message each.

Vivek · solo · Melbourne

**DARK FACTORY
HACKATHON**

158/158

official checks passed

4 stages

four seats, one room

coordinator

implementer

frontend

reviewer

WHAT THE HACKATHON ASKED FOR

A table must never be double-booked

Not with two guests at once, not on a retry, not across a daylight saving change.

50%

Factory

How the room is set up, and how far it got.

25%

App

What the factory built.

25%

Agent teamwork

The seats worked together, without me.

The rule is built into every stage, and each stage is graded by official checks.

THE FACTORY

One room, four agents

Coordinator

Plans the work and accepts it.

Implementer

Builds the back end.

Frontend

Builds every screen.

Reviewer

Checks everything. Never fixes.

```
mandates/df-coordinator.md
```

```
Harness: Claude Code
```

```
Model: claude-sonnet-5
```

```
# df-coordinator
```

```
You plan, delegate and accept. You do not write  
code and you do not review code.
```

One mandate per seat

A short file on what the seat owns and how it works. Nothing about reservations, so another team could reuse it.

Then one message per stage. The agents take it from there.

Claude Code in one BAND room: Sonnet for three seats, Opus for the frontend. The implementer chose the technology.

HOW IT RUNS

Four stages: build, review, accept

STAGE 1

Reservations API

Sign-in, safe retries, daylight saving, moving bookings.

STAGE 2

Booking screens

Search, an availability grid, combined tables.

STAGE 3

Policies and repeats

Booking policies, history, weekly recurring bookings.

STAGE 4

Service recovery

Close a table and see where the bookings would move.

Build

The implementer and frontend build it and commit.

Review

The reviewer checks it from scratch. Never fixes.

Accept

The coordinator accepts only a commit the reviewer checked.

Problems found are fixed and re-checked before a stage passes.

THE RESULT

What the agents built

Guided first screen.

Availability grid, with combined tables.

Phone width.

Screenshots of the running app. Final build (stage 4), dark theme, built by the frontend seat.

RESULTS

158 of 158 official checks

STAGE 1

120/120

API, 66 min

STAGE 2

25/25

Booking UI, 162 min

STAGE 3

7/7

Policies, 123 min

STAGE 4

6/6

Replanning, 110 min

7 h 40

first dispatch to last report

\$180

BAND's estimate for the room

~510M

tokens across the four seats

I ran the official harness myself at revision d268821. A fresh clone of the repo at ca60ade passes the same way.

Thank you

To lablab, WeAreDevelopers and BAND for hosting Dark Factory.
